# 1. INTRODUCTION

Chat refers to the process of communicating, interacting and/or exchanging messages over the Internet. It involves two or more individuals that communicate through a chat-enabled service or software. Chat may be delivered through text, audio or video communication via the Internet.

The chat application we are going to make will be more like a chat room, rather than a peer to peer chat. So, this means that multiple users can connect to the chat server and send their messages. Every message is broadcasted to every connected chat user.

## 1.1 DOCUMENT SCOPE AND PURPOSE

This document provides a description of the technical design for Chat-Application U\_CHAT. This document provides an architectural overview of the system to depict different aspects of the system. This document also functions as a foundational reference point for developers.

## 1.2 TARGET AUDIENCE

This document is targeted (but not limited) to technical stakeholders:

- Development Team
- Clients
- Respective Authority

It is assumed that the reader has a technical background in software design and development.

## 2. REQUIREMENT ANALYSIS

### 2.1 SYSTEM REQUIREMENT

- Development: Python + Flask
- Unit Test: unit test(localhost)
- Database Management: Mongo DB
- Database: Document-Oriented NoSQL
- Server: Mongo Client
- Discussion: Normal Group Discussion

### 2.2 TOOLS REQUIREMENTS

#### 2.2.1 Python

It's often used as a "scripting language" for web applications. This means that it can automate specific series of tasks, making it more efficient. Consequently, Python (and languages like it) is often used in software applications, pages within a web browser, the shells of operating systems and some games.

#### 2.2.2 HTML

(Hypertext markup language) is the set of markup symbols or codes inserted in a file intended for display on a World Wide Web browser page.

#### 2.2.3 FLASK

**Flask** is a web framework. This means **flask** provides you with tools, libraries and technologies that allow you to build a web application. This web application can be some web pages, a blog, a wiki or go as big as a web-based calendar application or a commercial website.

#### 2.2.4 Mongo DB

**MongoDB** is a document-oriented NoSQL database **used** for high volume data storage. Instead of using tables and rows as in the traditional relational databases, **MongoDB** makes **use** of collections and documents. Documents consist of key-value pairs which are the basic unit of data in **MongoDB**.

## 3. DESIGN

### 3.1 DESIGN APPROACH

The design approach used here is based on the following:

- I. **DATA FLOW DESIGN:** The data flow of the Chat Application U CHAT is Internet-based.
- II. **ARCHITECHTURE DESIGN:** The Chat Application is developed with the help of Python, bson, werkzeug, flask, flask-socketio, eventlet, flask-login. The database used is NoSQL, and the web application is deployed through mongo client (pymongo) Server.
- III. **UI DESIGN:** The Internal Complaint Management System uses HTML, CSS at the Front End. It has been made such that the web application is very user friendly and all the functions present will make the life of user easier.

### 3.2 DESIGN PATTERNS

This application is designed as an object-oriented system for an Internet-based architecture by factoring application classes into the following layers:

- I. **The Presentation layer:** This is the layer where the physical window and widget objects live. Any new user interface widgets developed for this application are put in this layer.
- II. **THE DOMAIN MODE:** Most objects identified in the OO analysis and design will reside. To a great extent, the objects in this layer can be application-independent. Generic objects may be used in this application to reap the benefits of Object-Oriented programming.
- III. **THE DATA LAYER:** The data is managed by NoSQL.

## 3.3 FLOW CHARTS

### 3.2.1 U CHAT Home

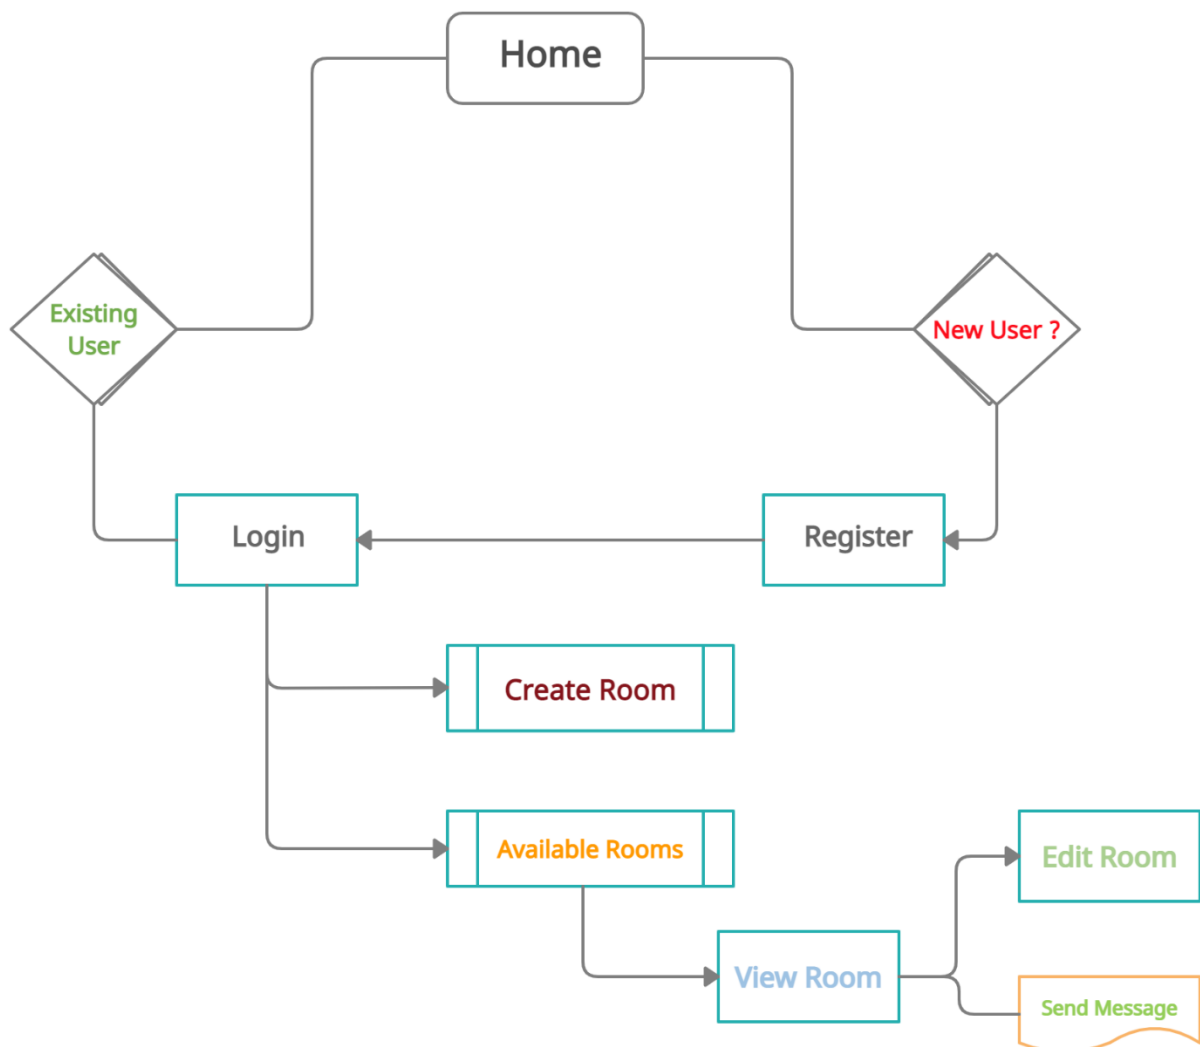

Chat Application U CHAT

### 3.2.2 User Login/Registrations and User Chatting Space

#### Chat Application U CHAT

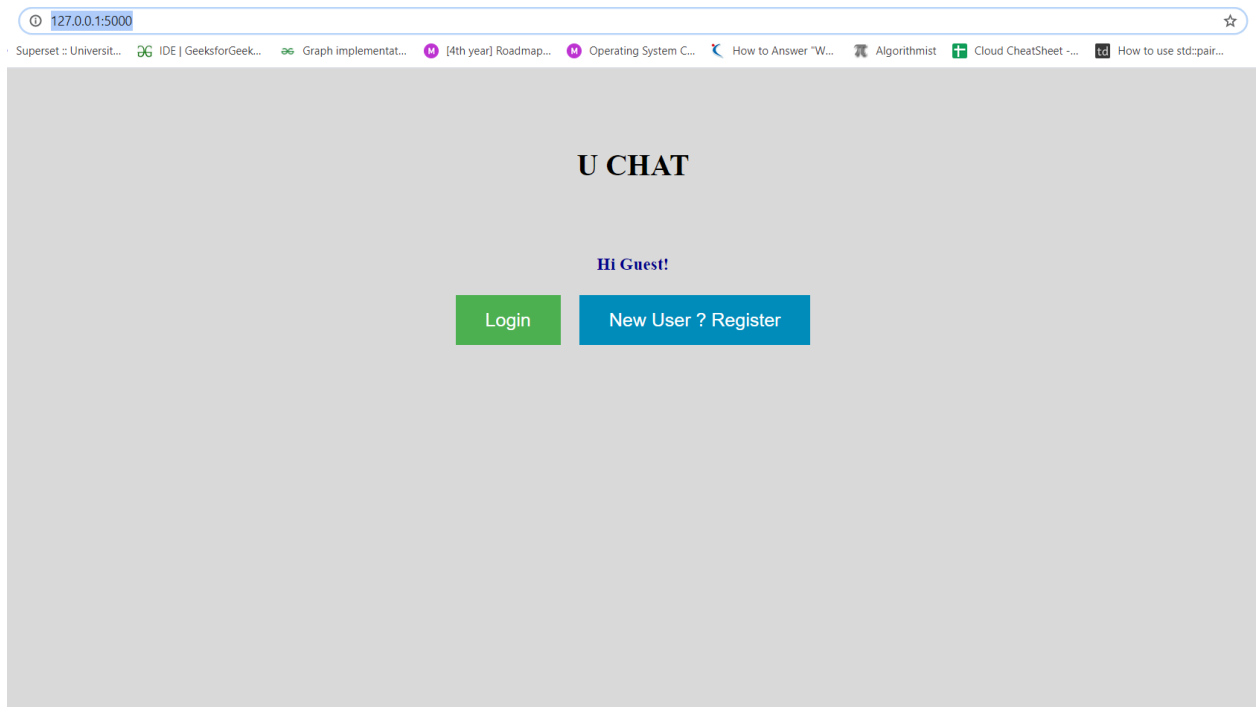

## 4. IMPLEMENTATION

### 4.1 DATA DICTIONARY

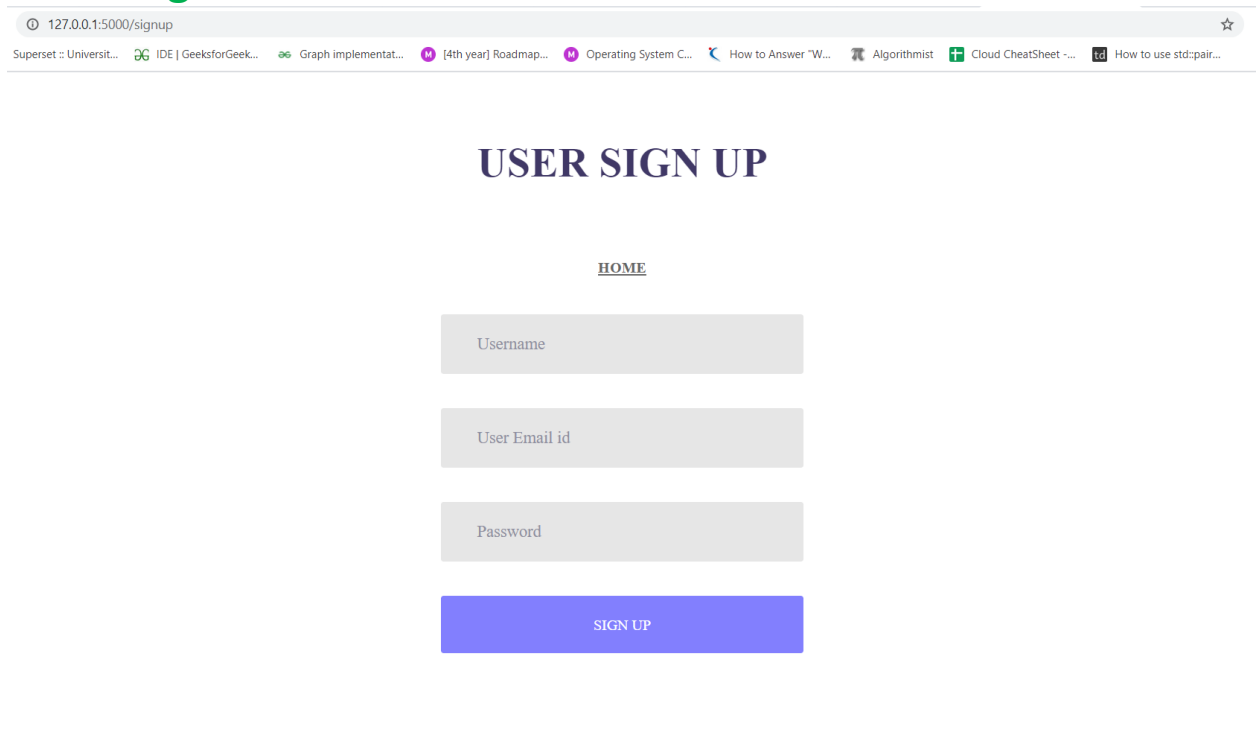

|              |               |               |
|--------------|---------------|---------------|
|              |               |               |
| users        | _id           | Varchar (225) |
|              | email         | Varchar (255) |
|              | password      | Varchar (225) |
|              |               |               |
| message      | _id           | Int (11)      |
|              | room_id       | Varchar (225) |
|              | text          | Varchar (225) |
|              | sender        | Varchar (225) |
|              | created_at    | timestamp     |
|              |               |               |
| room_members | _id           | Int (11)      |
|              | room_name     | Varchar (225) |
|              | added_by      | Varchar (225) |
|              | added_at      | timestamp     |
|              | is_room_admin | text          |
|              |               |               |
| rooms        | _id           | Int (11)      |
|              | name          | Varchar (225) |
|              | created_by    | Varchar (225) |
|              | created_at    | Timestamp     |
|              |               |               |

## 5. TESTING

### 5.1 TESTING GOAL

The goal of Employee Leave Management System Testing is to ensure that the system performs as per the functional requirements specified by client. Most cases tested here are done manually per module.

### 5.2 FUNCTIONAL REQUIREMENTS TESTING (BLACK BOX TESTING)

#### 5.2.1 Registration for New User

| <b>Description:</b> This test will ensure registration of new user |   |  |         |
|--|---|--|---------|
| <b>Data Requirements:</b> Connectivity to database                 |   |  |         |
| Steps #  | Step Description                                      | Expected Results                                     | Remarks |
| 1  | Open sign Up page                                     | Sign Up page opens                                   | Pass    |
| 2  | Enter Username  | Checked Existence of Username                        | Pass    |
| 3  | Enter Email   | Checked Existence of Username                        | Pass    |
| 4  | Fill Registration Form Password and Click on register | Checked Type of Password and registration successful | Pass    |
| 5  | Login using credential entered on Sign Up page        | Successfully Logged in                               | Pass    |

## 5.2.2 Send Message by User to any Room

| <b>Description:</b> This test will ensure that message send successfully |  |  |         |
|--|--|--|---------|
| <b>Data Requirements:</b> Connectivity to complaint Database             |  |  |         |
| Steps #  | Step Description                                 | Expected Results   | Remarks |
| 1  | Sign In using username and password              | Dashboard of Student which shows name of rooms available | Pass    |
| 2  | If no room created earlier, click on Create Room | Create Room Opens  | Pass    |
| 3  | Choose Room and Open chosen Room                 | Type text in the text box                                | Pass    |
| 4  | Submit form                                      | Message Send Successfully and check by clicking History  | Pass    |

## 5.3 Non- Functional Requirements Testing

### 5.3.1 Stability Testing

Stability testing checks to see if the software can continuously function well in or above an acceptable period. This activity of non-functional software testing is oftentimes referred to as load (or endurance) testing.

### 5.3.2 Usability

Usability testing is needed to check if the user interface is easy to use and understand. This test is used to verify if a user that never use the application can search and read result list within a reasonable time.

### 5.3.3 Security Testing

Security testing is essential for software which processes confidential data and to prevent system intrusion by hackers.

## 6. MAINTAINENCE

The Chat Application U CHAT is developed using Python, HTML, CSS, Flask and MangoDB. Thus, it provides an easy Maintainability and Optimization.

Software maintenance in software engineering is the modification of a software product after delivery to correct faults, to improve performance or other attributes. Maintenance covers about 60% of the phase in Software Development Life Cycle.

The U CHAT is the soul property of Himanshu Ranjan & Abhishek Kumar and is developed for all type of users of **the world**. The group shall provide regular updates for the maintenance of the U CHAT Application.

### **The Maintenance of U CHAT shall include:**

- Error Correction
- Bug Fixes
- Enhancement of Capabilities
- Updating of Obsolete Capabilities
- Optimization

The U CHAT Application has been developed for simplifying the process of messaging, matters of the Users and thus it is not affordable to have bugs in the Application but nonetheless some sneaky bugs may find its way to the users. The users are requested to report the bugs as soon as they encounter it so that it could be fixed in the next update.

## 7. CONCLUSION

Overall, we would class this project as a success. Everything that was outlined in the early stages of the project was achieved and a lot of extra features were also added.

In this project we have used the basics of networking in python. We also learned how to make a GUI for our application. This project teaches us how to create a basic chat application by creating GUI using flask and socketio.
